

# 01 | Case Study

Development of analytical model for Flotation circuit optimisation

## Business Opportunity

Vantaz was engaged to build a multi-disciplinary team whose mission was to increase flotation circuit recovery through advanced analytical modelling, helping the shift supervisor / metallurgist / operator to make better decisions.

## Solution

Vantaz developed strategies for increasing flotation circuit recovery through machine learning models to predict, simulate and deliver optimisation recommendations.

- › Deliver recommendations for operational set points and operating ranges, for example:
  - Airflow in a column.
  - Foam level in a conventional cell.
- › Provide recommendations for the addition of reagents, e.g.:
  - › pH (CAL)
    - Primary and secondary collectors
    - Nash
    - Foamer

## Results

- › Improve recovery by 0.5% -1.5% in the flotation circuit.
- › Enabled operation at optimal operating points.
- › Created ability to perform simulations of operational changes.
- › Improved understanding of the impact of variables on the process.
